

*ABSTRACT AMENDMENTS*

Replace the Abstract with:

~~In a~~ A multi-layer printed board including a plurality of signal layers, each ~~provided with signal layer including~~ a signal line, a through-hole, and a ground through-hole, ~~the~~. The signal layer ~~is provided with~~ includes a land connecting the through-hole and the signal line. An external periphery of the land has a first portion of a ~~maximum radius where a distance farthest from a center of the land is a maximum distance~~, and a second portion of a ~~shorter radius having~~ extending a shorter distance from the center of the land than the first portion of ~~the maximum radius~~. A portion of the external periphery of the land opposite to the ground through-hole ~~most adjacent~~ closest to the center of the land, ~~is formed of the second portion of the shorter radius~~. Consequently, impedance matching can be improved even if a signal frequency is high.
